The Stata Journal publishes reviewed papers together with shorter notes or comments, regular columns, book reviews, and other material of interest to Stata users. Examples of the types of papers include 1) expository papers that link the use of Stata commands or programs to associated principles, such as those that will serve as tutorials for users first encountering a new field of statistics or a major new technique; 2) papers that go “beyond the Stata manual” in explaining key features or uses of Stata that are of interest to intermediate or advanced users of Stata; 3) papers that discuss new commands or Stata programs of interest either to a wide spectrum of users (e.g., in data management or graphics) or to some large segment of Stata users (e.g., in survey statistics, survival analysis, panel analysis, or limited dependent variable modeling); 4) papers analyzing the statistical properties of new or existing estimators and tests in Stata; 5) papers that could be of interest or usefulness to researchers, especially in fields that are of practical importance but are not often included in texts or other journals, such as the use of Stata in managing datasets, especially large datasets, with advice from hard-won experience; and 6) papers of interest to those teaching, including Stata with topics such as extended examples of techniques and interpretation of results, simulations of statistical concepts, and overviews of subject areas.

For more information on the Stata Journal, including information for authors, see the web page http://www.stata-journal.com

Subscriptions are available from StataCorp, 4905 Lakeway Drive, College Station, Texas 77845, telephone 979-696-4600 or 800-STATA-PC, fax 979-696-4601, or online at http://www.stata.com/bookstore/sj.html

Subscription rates:

Subscriptions mailed to US and Canadian addresses:

- 3-year subscription (includes printed and electronic copy) $153
- 2-year subscription (includes printed and electronic copy) $110
- 1-year subscription (includes printed and electronic copy) $59
- 1-year student subscription (includes printed and electronic copy) $35

Subscriptions mailed to other countries:

- 3-year subscription (includes printed and electronic copy) $225
- 2-year subscription (includes printed and electronic copy) $158
- 1-year subscription (includes printed and electronic copy) $83
- 1-year student subscription (includes printed and electronic copy) $59
- 3-year subscription (electronic only) $153

Back issues of the Stata Journal may be ordered online at http://www.stata.com/bookstore/sj.html

The Stata Journal is published quarterly by the Stata Press, College Station, Texas, USA.

Address changes should be sent to the Stata Journal, StataCorp, 4905 Lakeway Drive, College Station TX 77845, USA, or email sj@stata.com.
Stata tip 6: Inserting awkward characters in the plot

Nicholas J. Cox, University of Durham, UK
n.j.cox@durham.ac.uk

Did you know about the function char()? char(n) returns the character corresponding to ASCII code n for 1 \leq n \leq 255. There are several numbering schemes for so-called ASCII characters. Stata uses the ANSI scheme; a web search for “ANSI character set” will produce tables showing available characters. This may sound like an arcane programmer’s tool, but it offers a way to use awkward text characters—either those not available through your keyboard or those otherwise problematic in Stata. A key proviso, however, is that you must have such characters available in the font that you intend to use. Fonts available tend to vary not only with platform but even down to what is installed on your own system. Some good fonts for graphics, in particular, are Arial and Times New Roman.

Let us see how this works by considering the problem of inserting awkward characters in your Stata graphs, say as part of some plot or axis title. Some examples of possibly useful characters are

\begin{verbatim}
char(133)   ellipsis     ...  
char(134)   dagger       †     
char(135)   double dagger ‡     
char(169)   copyright    ©     
char(176)   degree symbol °     
char(177)   plus or minus ±     
char(178)   superscript 2 ²     
char(179)   superscript 3 ³     
char(181)   micro symbol  μ     
char(188)   one-fourth   ¼     
char(189)   one-half      ½     
char(190)   three-fourths ¾     
char(215)   multiply      ×
\end{verbatim}

There are many others that might be useful to you, including a large selection of accented letters of the alphabet. You can use such characters indirectly or directly. The indirect way is to place such characters in a local macro and then to refer to that macro within the same program or do-file.

For example, I use data on river discharge, for which the standard units are cubic meters per second. I can get the cube power in an axis title like this:

\begin{verbatim}
  . local cube = char(179)
  . scatter whatever, xtitle("discharge, m'^{3}/s")
\end{verbatim}
Or, I have used Hanning, a binomial filter of length 3:

```
. local half = char(189)
. local quarter = char(188)
. twoway connected whatever,
   > title("Smoothing with weights 'quarter':'half':'quarter'")
```

The direct way is to get a macro evaluation on the fly. You can write `=`char(176)` and, in one step, get the degree symbol (for temperatures or compass bearings). This feature was introduced in Stata 7 but not documented until Stata 8. See `[p] macro`. `char()` has many other uses besides graphs. Suppose that a string variable contains fields separated by tabs. For example, `insheet` leaves tabs unchanged. Knowing that a tab is `char(9)`, we can

```
. split data, p(=char(9)) destring
```

Note that `p(char(9))` would not work. The argument to the `parse()` option is taken literally, but the function is evaluated on the fly as part of macro substitution.

Note also that the SMCL directive `{c #}` may be used for some but not all of these purposes. See `[p] smcl`. Thus,

```
. scatter whatever, xtitle("discharge, m[c 179]/s")
```

would work, but using a SMCL directive would not work as desired with `split`.
