The Stata Journal publishes reviewed papers together with shorter notes or comments, regular columns, book reviews, and other material of interest to Stata users. Examples of the types of papers include 1) expository papers that link the use of Stata commands or programs to associated principles, such as those that will serve as tutorials for users first encountering a new field of statistics or a major new technique; 2) papers that go “beyond the Stata manual” in explaining key features or uses of Stata that are of interest to intermediate or advanced users of Stata; 3) papers that discuss new commands or Stata programs of interest either to a wide spectrum of users (e.g., in data management or graphics) or to some large segment of Stata users (e.g., in survey statistics, survival analysis, panel analysis, or limited dependent variable modeling); 4) papers analyzing the statistical properties of new or existing estimators and tests in Stata; 5) papers that could be of interest or usefulness to researchers, especially in fields that are of practical importance but are not often included in texts or other journals, such as the use of Stata in managing datasets, especially large datasets, with advice from hard-won experience; and 6) papers of interest to those teaching, including Stata with topics such as extended examples of techniques and interpretation of results, simulations of statistical concepts, and overviews of subject areas.

Stata tip 7: Copying and pasting under Windows

Shannon Driver Patrick Royston
StataCorp MRC Clinical Trials Unit, London
sdriver@stata.com patrick.royston@ctu.mrc.ac.uk

Windows users often copy, cut, and paste material between applications or between windows within applications. Here are two ways you can do this with Stata for Windows. We will describe one as a mouse-and-keyboard operation and the other as a menu-based operation. Experienced Windows users will know that these methods are, to a large extent, alternatives.

First, you can highlight some text in the Results window, copy it using the mouse (or keyboard), and then paste it into the Command window, the Do-file Editor, or anywhere else appropriate. This is a convenient way to transfer, for example, single values, lists, or sets of variable names from the screen for use in the next command. To copy text, place your mouse at the beginning of the desired text, drag to the end, thus highlighting the selected text, and press Ctrl-C. To paste text, click your mouse at the appropriate place and press Ctrl-V.

Suppose that a local macro ‘macro’ holds some text you wish to use. Then type

```
. display "'macro'"
```

and copy and paste the contents of ‘macro’ for editing in the Command window. Or, list in alphabetic order the names of variables not beginning with _I:

```
. ds _I*, not alpha
```

and then copy and paste the list into the Do-file Editor.

Second, suppose that you want to save a table constructed using tabstat in a form that makes it easy to convert into a table in MS Word. Stata has a Copy Table feature that you might find very useful. Make sure at the outset that you have set suitable options by clicking Edit in the menu bar and then Table Copy Options. In this case, removing all the vertical bars is advisable, so make sure Remove all is selected, and click OK. Now highlight the table in the Results window, and then click Edit and then Copy Table.

In MS Word, click Edit and then Paste. Highlight the pasted text and then click Table and then Convert and Text to Table. Specify Tabs under the Separate text at if it is not already selected. Click OK to create your table.
